English

Upper-Intermediate

Education

Master of Science in Computer Science

Faculty of Heat Power Engineering

NTUU "Igor Sikorsky Kyiv Polytechnic Institute"

2016 – 2022

Tech stack

- Java 8 - 25
- Spring Boot, MVC, GraphQL, gRPC, Data JPA/JDBC/NoSQL, Security
- Hibernate, jOOQ
- Postgres
- FlyWay
- Cassandra, Redis, MongoDB
- Solr, Elasticsearch
- REST, GraphQL (Apollo Federation), gRPC (with Streaming), WebSockets
- Keycloak
- Kafka, RabbitMQ, Kafka Streams
- JUnit, Mockito, Cucumber, Wiremock
- Maven, Gradle
- Grafana, Kibana
- Jaeger
- Docker, Compose
- Kubernetes, Helm
- AWS

Profile

I have been working as a Java software engineer since the second half of 2018. Work with backend development, cloud-based solutions, software architecture, high-load, distributed, large-scale systems.

Experience

March 2024 – March 2026

Pharos Production (Kyiv, Ukraine)

Senior Java software engineer on a high-load web3 microservices platform (40+ microservices) running on AWS under self-hosted k8s.

Technologies: Java 21-25, Spring Boot, Data, Security, gRPC, GraphQL, REST, RabbitMQ, Kafka, Kafka Streams, Flink, Cassandra, Solr, PostgreSQL, Ignite, Kubernetes, Jenkins jobs, AWS, Maven, JUnit, Mockito, Wiremock, GitHub.

Responsibilities:

- Design and implement solutions for business issues. From epics/stories creation in a ticket system like Jira to ready implementations based on microservices that were deployed to the prod cluster
- Integrations with third-party products. Communication with external developers, project owners, creation of own documented public APIs and solutions for push/pull communications with external APIs
- New microservices development and testing — full lifecycle from technical design and solving disputed points to implementation, Helm chart creation with CI/CD deployment on Kubernetes, and documentation
- Updates for Java/Spring and related libraries on the new versions.
- Research and fix problems in the production environment
- POCs implementation in order to try new approaches, technologies, concepts, like stream processing with Flink instead of Kafka Streams or custom Spring starters, API testing based on Jenkins jobs.

Achievements: system design and implementation for new epics. Contributed to the project framework (starters for work with Solr, RabbitMQ, healthchecks). New approach to common domain models building and reuse. Created from scratch automated API tests for all public REST services.

May 2021 – May 2023

Digitally Inspired Ltd (Kyiv, Ukraine)

Strong middle Java software engineer on a retail microservices platform (100+ microservices) running on AWS under the EKS service.

Technologies: Java 11-17, Spring Boot, Data, Security, GraphQL (DGS framework, Apollo Federation), REST, Kafka, Kafka Streams, Keycloak, jOOQ, PostgreSQL, MongoDB, Redis, Elasticsearch, Kibana, Jaeger, Docker, Compose, Kubernetes, Helm, AWS, Gradle, JUnit, Mockito, Cucumber, Wiremock, GitLab pipeline.

Responsibilities:

- Design and creation of new microservices — full lifecycle from technical design and solving disputed points to implementation, Helm chart creation with CI/CD deployment on Kubernetes, and documentation

- AI agentic (IntelliJ IDEA's AI extension, Cursor, Claude Code)

- Worked both alone and with technical architects, the team lead, and engineers from my own and third-party teams (integrations, DevOps, frontend, mobile)
- Took an active part in decision calls about new features, topology, and solutions on the platform and team levels
- Researched and fixed problems in the production environment related to deployed microservices
- Implemented POCs: Google Drive integration research and integration into our microservices; created the first microservice with the DGS framework instead of default GraphQL-Java libraries.

Achievements: mastered GraphQL and Kubernetes with Helm; contributed to the project framework (new features to libraries for work with Keycloak, Jooq, and Kafka), mentoring for new employees on the project.

Dec 2020 – Mar 2021

Inmost (Kyiv, Ukraine)

Middle Java software engineer on a healthcare project.

Technologies: Java, Spring Boot, Data, JDBC, REST, Jenkins, Git, JUnit, Mockito

Responsibilities:

- New business features and work with Spring Data queries
- Performance improvement of backend modules (profiling and refactoring of the codebase)
- Developing new REST API endpoints
- Managing and extending the integration with the CI (Jenkins) for microservices

Achievements: code refactoring with performance improvement, code review approach improvement in the team, and help with CI pipeline optimization.

Jul 2019 – Nov 2020

ProFix (Kyiv, Ukraine)

Junior, then Java software engineer on the banking project (money transfer system).

Technologies: Java, Spring, Spring Data, SQL (Oracle, Postgres), REST, SOAP, Maven, Git

Responsibilities:

- New features creation for clients (new business logic on the backend side) and new API endpoints
- Native (JDBC) and Spring Data queries to the DB (Oracle, Postgres — CRUD, aggregations) and DB updates (DDL)
- Updates for the report list and worked with SQL queries and reports (analytics)
- Integrations with third-party systems (via REST and SOAP)
- Mentoring for the new teammates

Achievements: improved skills in the REST approach (different new API endpoints for various business purposes), complex SQL queries in reports, code refactoring that led to performance improvement, and first steps as a mentor.

Oct 2018 – Mar 2019

Freelance

Responsibilities:

- REST APIs creation and implementation of business logic on the backend side, JavaFX application.
- Worked with third-party APIs for students' diplomas and laboratory works
